

ABSTRACT OF THE DISCLOSURE

Mass amounts of information, such as entire libraries of songs or movies, for example, are stored locally near end-users, and this information is accessed and reproduced in response to commands received from a transmitting station via a network.

5 When a radio or television station desires to transmit a song or movie, for example, the radio or television station can, rather than transmitting the entire song or movie, merely transmit a command for reproducing the song or movie. An end-user's performance reproduction device, such as an enhanced radio or a television set, then accesses and reproduces the locally stored song or movie. Since the radio or television station need
10 not transmit the entire performance, network traffic can be significantly reduced.
